This Comment strongly supports the EPA Administrator's proposed decision to retain the current **National Ambient Air Quality Standards for Particulate Matter**, as described in the April 30, 2020 Federal Register. The summary of this decision is "Based on the Environmental Protection Agency's (EPA's) review of the air quality criteria and the national ambient air quality standards (NAAQS) for particulate matter (PM), the Administrator has reached proposed decisions on the primary and secondary PM NAAQS. With regard to the primary standards meant to protect against fine particle exposures (*i.e.,* annual and 24-hour PM2.5 standards), the primary standard meant to protect against coarse particle exposures (*i.e.,* 24-hour PM10 standard), and the secondary PM2.5 and PM10 standards, the EPA proposes to retain the current standards, without revision." and "the Administrator proposes to conclude that the scientific evidence that has become available since the last review of the PM NAAQS, together with the analyses in the PA based on that evidence, does not call into question the public health protection provided by the current annual and 24-hour PM2.5 standards." Currently, the EPA has primary and secondary standards for PM2.5 (annual average standards with levels of 12.0 micrograms per cubic meter ($\mu g/m^3$) and 15.0 $\mu g/m^3$, respectively; 24-hour standards with 98th percentile forms and levels of 35 $\mu g/m^3$; values are averaged over 3 years).

1. The first justification for retaining the current PM NAAQS is contained in the 257-page December 16, 2019 EPA Clean Air Scientific Advisory Committee (CASAC) PM Policy Assessment (PA) Report. The CASAC Chair LOUIS ANTHONY (TONY) COX, JR., PhD, is a distinguished scientist and a renowned expert in the health risks associated with PM2.5. His impressive background is summarized in his own Bio Sketch shown below.

LOUIS ANTHONY (TONY) COX, JR., PH.D., BIO SKETCH
(http://cox-associates.com/index_htm_files/Coxbio.pdf)
Cox Associates, 503 Franklin Street, Denver, Colorado, 80218
(303)-388-1778 (Phone); (303)-388-0609 (Fax); tcoxdenver@aol.com

Tony Cox is a risk analyst and President of Cox Associates (www.cox-associates.com), a Denver-based applied operations research and analytics company specializing in data science and statistics applied to public and occupational health, safety, and environmental risk analysis; epidemiology; policy analytics; and customer behavior modeling. Since 1986, Cox Associates' analysts and scientists have applied epidemiological, risk analysis, and operations research models and advanced analytics to measurably improve health and environment risk assessment and decision-making for public and private sector clients. In 2006, Cox Associates was inducted into the Edelman Academy of the Institute for Operations Research and Management Science (INFORMS), recognizing outstanding real-world achievements in the practice of operations research and the management sciences. In 2012, Dr. Cox was inducted into the National Academy of Engineering (NAE), "For applications of operations research and risk analysis to significant national problems." He has served as a member of the National Academies' Board on Mathematical Sciences and their Applications (BMSA) (2012-2016) and currently chairs the Clean Air Scientific Advisory Committee (CASAC) for the United States Environmental Protection Agency (EPA).

Dr. Cox holds a Ph.D. in Risk Analysis and an S.M. in Operations Research, both from MIT; an AB from Harvard University; and is a graduate of the Stanford Executive Program. He has served as Honorary Full Professor of Mathematics at the University of Colorado, Denver, lecturing on applied statistics, data science, decision and risk analysis, biomathematics, health risk modeling, and causality; on the Faculties of the Center for Computational Mathematics and the Center for Computational Biology; and as Clinical Professor of Biostatistics and Informatics at the University of Colorado Health Sciences Center. He has served as an expert in risk analysis on many National Academies, World Health Organization, EPA, USDA, and other agency projects, committees, and advisory boards.

Dr. Cox is Editor-in-Chief of *Risk Analysis: An International Journal.* He is Area Editor for Real World Applications for the *Journal of Heuristics,* and is on the Editorial Boards of *Decision Analysis* and the *International Journal of Operations Research and Information Systems*. He is a Fellow and an Edelman Laureate of INFORMS, a member of the American Statistical Association (ASA), and a lifetime Fellow of the Society for Risk Analysis (SRA). In 2015 and 2018, his research applying machine learning to high-throughput screening data for endocrine disruptors and carcinogenicity won Best Published Papers Demonstrating an Application of Risk Assessment awards from the Society of Toxicology Risk Assessment Specialty Section. His previous research has won the Society of Toxicology's Outstanding Published Paper in Risk Assessment Award and the Society for Risk Analysis Outstanding Risk Practitioner Award. In 2008, his solution to a challenge on "Statistical Methods to Predict Clinical Response" won an Inno Centive Award.

Dr. Cox has taught many graduate and professional courses in risk analysis, decision analysis, and advanced analytics. He has authored and co-authored over 200 journal articles and book chapters on these fields. His most recent books are *Causal Analytics for Applied Risk Analysis*(Springer, 2018), *Breakthroughs in Decision Science and Risk Analysis* (Wiley, 2015), *Improving Risk Analysis* (Springer, 2013), *Risk Analysis of Complex and Uncertain Systems* (Springer, 2009) and the *Wiley Encyclopedia of Operations Research and Management Science* (Wiley, 2011), which Dr. Cox co-edited. He has over a dozen U.S. patents on applications of artificial intelligence, signal processing, statistics and operations research. His current research interests include computational statistical methods for causal inference in public and occupational health risk analysis, data-mining, and advanced decision analysis, optimization, and learning in uncertain and changing environments.

Key quotes from the December 16, 2019 CASAC PM PA Report, with key phrases in bold, are as follows:

Page 1: The Draft PM PA depends on a Draft Particulate Matter (PM) Integrated Science Assessment (ISA) that, as noted in the April 11, 2019, CASAC Report on the Draft PM ISA, does not provide a sufficiently comprehensive, systematic assessment of the available science relevant to understanding the health impacts of exposure to PM, due largely to a lack of a comprehensive, systematic review of relevant scientific literature; inadequate evidence and rationale for altered causal determinations; and a need for clearer discussion of causality and causal biological mechanisms and pathways. Given these limitations in the underlying science basis for policy recommendations, and diverse opinions about what quantitative uncertainty analysis and further analysis of all relevant data using the best available scientific methods would show, **some CASAC members conclude that the Draft PM PA does not establish that new scientific evidence and data reasonably call into question the public health protection afforded by the current 2012 PM2.5 annual standard**.

Page 3: Future changes in public health risks that might be caused by reducing PM2.5 exposures are currently highly uncertain. The CASAC recommends that the PM PA better characterize this uncertainty using quantitative uncertainty analysis. Such an analysis should account for model uncertainty, exposure estimation errors, and both inference (internal validity) and generalization (external validity) uncertainties. As described above and in further detail in the consensus responses, the CASAC members did not come to consensus on whether the new scientific evidence and data reasonably call into question the public health protection afforded by the current 2012 PM2.5 annual standard. The CASAC recommends that the final PM PA provide quantitative uncertainty and sensitivity analyses to provide a clearer technical and scientific basis for data interpretation and policy making. **The CASAC agrees with the EPA and finds that the available evidence does not call into question the adequacy of public health protection afforded by the current 24-hour PM2.5 standard and concurs that it be retained.**

Page B-10: To "serve as a source of policy-relevant information that informs the Agency's review of the NAAQS for PM," the PA should use valid and empirically validated scientific methods to address the question of whether and how much changes in policy would affect public health risks. As just mentioned, the current draft PA is based largely on epidemiological evidence of positive associations between exposures and health effects in studies that do not fully test and control for confounding, coincident historical trends, and other non-causal sources of associations. These associations (such as the beta coefficients in Table C-1) are then used as if they were known to be valid causal predictors for simulating how changes in exposure would change health risks. This is not sound science. **The resulting conclusions and predictions are not scientifically valid and should not be used to guide policies that are to be based on sound science.**

Page B-19: The PA provides no valid scientific information about how changing PM air quality standards would change (or, in the recent past, has changed) public health risks. A scientifically sound analysis would require considering relevant real-world evidence that the PM has ignored ; clearly defining and then appropriately calculating beta values (or other formulas for quantifying causal effects on public health of changing PM2.5) while correcting for causally relevant covariates (e.g., month and high and low daily temperatures and other confounders), exposure estimation errors, and modeling errors and biases; and distinguishing between association and causation. **Since the PA does not do these things, it should not be used as if it provided valid scientific information about health risks.**

Page B-21: "The PA states (p. 3-21) that "The draft ISA concludes that, 'collectively, this body of evidence is sufficient to conclude that a causal relationship exists between long-term PM2.5 exposure and total mortality'." However, since "this body of evidence" consists primarily of associations in studies that did not fully control for causally relevant covariates (such as month and daily high and low temperatures) and that were not designed or analyzed to permit valid causal inferences, **the conclusion that "this body of evidence is sufficient to conclude that a causal relationship exists between long-term PM2.5 exposure and total mortality" is unwarranted. It is not implied by, or consistent with, the principles of sound science previously discussed.**

2. The second justification for retaining the current PM NAAQS is my extensive epidemiologic evidence that there is NO relationship between PM2.5 and total mortality in the US. This weak epidemiologic relationship drives the claim that PM2.5 *causes* premature deaths and the cost-benefit justification for many EPA Regulations. The evidence that there is NO relationship negates the primary public health justification for the PM2.5 NAAQS. There are six primary reasons that PM2.5 does not *cause* premature deaths:

a) No Etiologic Mechanism: This is no experimental proof that 1-5 lifetime grams (<μg/day) of PM2.5 causes death $PM_{2.5} \mu g/m^3$

b) Weak Epidemiologic Risk: Tiny positive relative risks (RR<1.10) do not prove that PM2.5 causes death and reductions of in PM2.5 levels have not clearly reduced the supposed mortality risks

c) Ecological Fallacy: PM2.5 monitors of ambient air provide inaccurate measurements of individual human exposure and there are NO PM2.5 measurements of individual exposure

d) Uncontrolled Confounding Variables: Co-pollutants, temperature, geography, and other factors can reduce or eliminate an apparent relationship

e) Access to Underlying Data: Enstrom independent analysis of American Cancer Society data (CA CPS I and CPS I) demonstrates the importance of access to underlying epidemiologic data (see next section)

f) Totality of US Cohort Studies Shows NO Relationship: Objective meta-analysis shows NO statistically significant relationship between long-term PM2.5 exposure and total mortality in nine US and six California prospective epidemiologic cohorts

My detailed October 17, 2019 Comment on the 2019 Draft EPA PM PA contains strong evidence that there is NO causal relationship between PM2.5 and total mortality in the US and it demonstrates the importance of access to underlying data as per the proposed EPA Transparency Rule. To illustrate the severe flaws in 2019 PM PA, I focus on the "All-cause mortality" portion of Figure 3-3 within Section 3.2.3 PM2.5 Concentrations in Key Studies Reporting Health Effects of Chapter 3 REVIEW OF THE PRIMARY STANDARDS FOR PM2.5 of the 2019 PM PA. A key sentence on page 3-52 states "To evaluate the PM2.5 air quality distributions in key studies in this review, we first identify the epidemiologic studies assessed in the draft ISA that have the potential to be most informative in reaching conclusions on the primary PM2.5 standards."

Unfortunately, Figure 3-3 on page 3-54 does not properly describe the results from the nine US prospective cohort studies of PM2.5 and total mortality. Figure 3-3 of 2019 PM PA deliberately misrepresents the US epidemiologic evidence on the relationship of PM2.5 to total (all cause) mortality and obscures the null relationship that exists in a proper meta-analysis of the nine major US cohort studies with published findings. Particularly troubling is the unjustified omission from the 2019 PM PA of my March 28, 2017 "Fine Particulate Matter and Total Mortality in Cancer Prevention Study Reanalysis" in *Dose-Response* (Enstrom 2017) and my May 29, 2018 "Response to Criticism" in *Dose-Response* (Enstrom 2018). My seminal reanalysis of ACS CPS II identified major flaws in Pope 1995, the key study underlying the 1997 PM NAAQS.

Instead of properly examining the detailed findings in my reanalysis, SECTION 11.2: Long-Term PM2.5 Exposure and Total Mortality of the 2018 PM ISA dismissed my reanalysis in two *inaccurate* sentences: "A recent reanalysis of early ACS results observed a null association between county-level averages of PM2.5 measured by the Inhalable Particle Network between 1979 and 1983 and deaths between 1982 and 1988 (HR: 1.01; 95% CI: 1.00, 1.02) (Enstrom, 2017). Inconsistencies in the results could be due to the use of 85 counties in the ACS analysis by Enstrom (2017) and 50 Metropolitan Statistical Areas in the original ACS analysis (Pope et al., 1995)."

A proper meta-analysis of the relationship between PM2.5 and total mortality in nine US cohort studies is given in the September 28, 2018 Intrepid Insight (II) article "Statistical Review of Competing Findings in Fine Particulate Matter and Total Mortality Studies".

II Table B3: Intrepid Insight Computation of Fixed and Random Effects Meta-Analysis

Nine US Cohorts That Analyzed Ambient Fine Particulate Matter (PM2.5) and Total (All-cause) Mortality

Relative Risk (RR and 95% CI) of Total Mortality Associated with Increase of 10 $\mu g/m^3$ in PM2.5

US Cohort Studies	Author Year	RR Table	F-U Years	RR	95%CI(L)	95%CI(U)
Veterans Study	Lipfert 2000	T6	1986-1996	0.890	0.850	0.950
Medicare (MCAPS) Eastern US	Zeger 2008	T3	2000-2005	1.068	1.049	1.087
Medicare (MCAPS) Central US	Zeger 2008	T3	2000-2005	1.132	1.095	1.169
Medicare (MCAPS) Western US	Zeger 2008	T3	2000-2005	0.989	0.970	1.008
ACS Cancer Prevention Study (CPS II)	HEI RR140 2009	T34	1982-2000	1.028	1.014	1.043
Nurses Health Study	Puett 2009	T3	1992-2002	1.260	1.020	1.540
Health Professionals FU Study	Puett 2011	T2	1989-2002	0.860	0.720	1.020
Harvard Six Cities Study (H6CS)	Lepeule 2012	T2	1974-2009	1.140	1.070	1.220
Agricultural Health Study	Weichenthal 2015	T2	1993-2009	0.950	0.760	1.200
NIH-AAPR Diet and Health Study	Thurston 2016	T2 F3	2000-2009	1.025	1.000	1.049
National Health Interview Survey	Parker 2018	T3corr	1997-2011	1.016	0.979	1.054
Intrepid Insight Random Effects Meta-Analysis	Summary RR			1.031	0.997	1.066

Q Test Statistic = 109.5100704   I^2 90.87%
Cochrane's Q Test for Homogeneity of Studies (Null Hypothesis: Studies are Homogenous)
P-Value = 6.69843E-19 → Since Studies fail Test for Homogeneity, Random Effects Meta-Analysis
Yields Summary RR = 1.031 (0.997-1.066), which is statistically consistent with 1.000 (NO relationship)

The original Zeger 2008 analysis of the Medicare cohort (MCAPS) was included in this meta-analysis rather than the Di 2017 analysis, because of the serious concerns about Di 2017 that I stated in my [October 12, 2017 *NEJM* letter](). Dominici, the key author on both studies, does not explain how the overall RR increased from 1.044 in the Zeger 2008 analysis to 1.073 in the Di 2017 analysis. Di 2017 does not even cite Zeger 2008. If the Medicare (MCAPS) cohort is removed from the meta-analysis because it does not properly control for confounders, II Table B4 shows that the Summary RR = 1.014 (0.973-1.057), which is also NO relationship.

Contrary to the evidence in the detailed II Table B3, the 2019 PM PA Figure 3-3 misrepresents the US evidence and inappropriately includes Canadian evidence. For instance, Figure 3-3 omits the null findings in the original Veterans Study (Lipfert 2000), as shown in II Table B3. In addition, Figure 3-3 includes results from the CPS II cohort twice (Pope 2015 and Turner 2016) and does not mention that my reanalysis found serious flaws in Pope 1995, HEI 2000, and HEI 2009. These flaws raise doubts about the validity of subsequent 'secret science' CPS II analyses by Pope and Turner. Figure 3-3 includes results from the Medicare cohort five times (Di 2017, Shi 2016, Wang 2017, Kiomourtzoglou 2016, Zeger 2008). There is no mention that the original Medicare study (Zeger 2008) is not consistent with the recent study (Di 2017). Figure 3-3 includes results from the Nurses Health Study twice (Puett 2009 and Hart 2015) and there is no mention that Puett 2009 and Puett 2011 omitted California subjects, who most likely had null findings. Inclusion of multiple hazard ratio (RR) results from the same cohort is inappropriate and gives the misleading impression that the RRs in most of the US cohorts are positive. Inclusion in Figure 3-3 of results from Canadian studies is totally inappropriate because these positive Canadian RRs are not relevant to PM2.5 findings and policy assessment in the US. To show how the 2019 PM PA presented these results, Figure 3-3 on page 3-54 of the 2019 PM PA is reproduced below. First, I document that there is NO relationship between PM2.5 and total mortality in California.

II Table B7: Intrepid Insight Computation of Fixed and Random Effects Meta-Analysis

Six CA Cohorts That Analyzed Ambient Fine Particulate Matter (PM2.5) and Total (All-cause) Mortality

Relative Risk (RR and 95% CI) of Total Mortality Associated with Increase of 10 $\mu g/m^3$ in PM2.5

| California Cohort Studies	Author Year	RR Table	F-U Years	RR	95%CI(L)	95%CI(U)
Adventist Health Study (AHSMOG)	McDonnell 2000	T3+	1977-1992	1.000	0.950	1.050

Hazard Ratio (95% CI): 0.9 1.0 1.1 1.2 1.3 1.4

3. The third justification for retaining the current PM NAAQS is the strong evidence that I provided in my March 18, 2020 Comment and my April 17, 2020 Comment in support of the March 18, 2020 Supplemental Proposed EPA Rule supplemental rule "Strengthening Transparency in Regulatory Science." in the Federal Register "This supplemental notice of proposed rulemaking (SNPRM) includes clarifications, modifications and additions to certain provisions in the Strengthening Transparency in Regulatory Science Proposed Rulemaking." On April 30, 2018, the EPA published its proposed rule in the Federal Register "This document proposes a regulation intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, including regulations for which the public is likely to bear the cost of compliance, with regard to those scientific studies that are pivotal to the action being taken, EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation." My independent access to underlying ACS data (CA CPS I and CPS II) made possible the NULL evidence that I have published shown NO relationship between PM2.5 and total mortality, as shown in II Table B3 and II Table B7 above.

The request for data underlying EPA regulations dates back to the May 16, 1994 CASAC Chair George T. Wolff, MD letter to EPA regarding the then forthcoming Particulate Matter Review: "As scientists affiliated with CASAC, we are concerned that the appropriate analyses be conducted prior to our review. In that spirit, we request that the Agency take steps to assure that crucial data sets linking exposure to particulate matter and health responses are available for analysis by multiple analytical teams, thereby assuring the validity of the results before they are used in making regulatory decisions on the National Ambient Air Quality Standards for Particulate Material." The full 1994 letter is shown below.

The June 13, 1996 CASAC Chair George T. Wolff, MD letter to EPA illustrates the weaknesses of the evidence regarding the establishment of the 1997 PM2.5 NAAQS. Of the eight PM experts in the three most relevant disciplines (epidemiology, toxicology, and statistics), four (Drs. Larntz, Mauderly, Sly, and Stolwijk) recommended an annual PM2.5 standard that varied from 15 to 30 μg/m³ and averaged 23.1 μg/m³, and four (Drs. McClellan, Menzel, Samet, and Speizer) recommended NO annual PM2.5 standard. The annual 1997 PM2.5 standard as set at 15 μg/m³, the low end of all these recommendations. A key quote from the letter states the uncertainties that still exist "The diversity of opinion also reflects the many unanswered questions and uncertainties associated with establishing causality of the association between PM2.5 and mortality. The Panel members who recommended the most stringent PM2.5 NAAQS, similar to the lower part of the ranges recommended by the Staff, did so because they concluded that the consistency and coherence of the epidemiology studies made a compelling case for causality of this association. However, the remaining Panel members were influenced, to varying degrees by the many unanswered questions and uncertainties regarding the issue of causality. The concerns include: exposure misclassification, measurement error, the influence of confounders, the shape of the dose-response function, the use of a national PM2.5 / PM10 ratio to estimate local PM concentrations, the fraction of the daily mortality that is 2.5 advanced by a few days because of pollution, the lack of an understanding of toxicological mechanisms, and the existence of possible alternative explanations." The full 1996 letter is shown below.

May 16, 1994

EPA-SAB-CASAC-COM-94-005

The Honorable Carol M. Browner
Administrator
U.S. Environmental Protection Agency
401 M Street, SW (1101)
Washington, DC 20460

Subject: Data Sets for PM_{10}

Dear Ms. Browner:

As you are aware, the Agency is in the early stages of preparing an updated document on "Air Quality Criteria for Particulate Material" which will in turn lead to a related Staff Position paper. The Agency staff has briefed the Clean Air Scientific Advisory Committee (CASAC) on the plans for developing the two documents. CASAC is charged with reviewing the scientific and technical underpinnings of Agency proposals for National Ambient Air Quality Standards. As scientists affiliated with CASAC, we are concerned that the appropriate analyses be conducted prior to our review.

In that spirit, we request that the Agency take steps to assure that crucial data sets linking exposure to particulate matter and health responses are available for analysis by multiple analytical teams, thereby assuring the validity of the results before they are used in making regulatory decisions on the National Ambient Air Quality Standards for Particulate Material.

From the Agency briefings, it is clear that substantial new data are available that will need to be considered in the new Criteria Document and Staff Position Paper. In particular, several recent published reports have indicated effects on both morbidity and mortality at about the level of the current PM_{10} standard. In some cases, the analyses are extremely complex because of the need to correct a wide range of potential confounders, such as temperature, cigarette smoking and other pollutants.

It is already apparent that these analyses and the related published papers will have a central role in the Criteria Document and Staff Position Paper, the related discussions and recommendations of the Clean Air Scientific Advisory Committee, and in your final decision on reaffirmation or revision of the standard for particulate material. In view of their importance, it is crucial that two or more groups analyze the same key data sets linking exposure and morbidity/mortality response to verify the adequacy of the complex analyses and that different analysts using the same data reach similar conclusions. The importance of such validations and
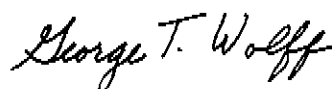

the difficulty in carrying them out was apparent from presentations on PM_{10} effects at a recent meeting at the National Academy of Sciences Beckman Center in Irvine, CA. At that meeting, divergent results were obtained by two different analytical teams which were reputed to have analyzed the same data. As it turned out, the data sets for the same city and time period analyzed by the two research teams had subtle differences. Hence, we are left with uncertainty as to the validity of either reported analysis.

The answer to this dilemma seems clear: The EPA should take the lead in requesting that investigators make available the primary data sets being analyzed so that others can validate the analyses. Further, the Agency should actively facilitate the conduct of such validating analyses. For example, the Agency could take steps to insure that the data are made available in an electronic media format that will facilitate transfer of the data to other teams for analysis.
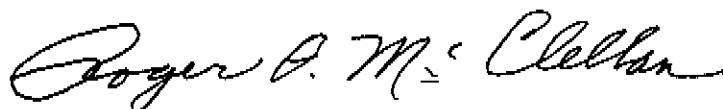

Efforts such as we have proposed may to time-consuming and require some expenditures. Nonetheless, modest expenditures to assure the scientific validity of key analyses that impact on regulatory decisions would seem to be appropriate investments where the regulatory decisions will have multibillion dollar impacts on society. Some might also argue that the kind of actions recommended infringe on the rights of individual scientists to control their own data. This is obviously a hollow argument recognizing that in almost all instances federal funds were used at least to some extent to obtain the original data. Moreover, it would appear that the steps outlined are essential steps for the Agency to take if it is to assure the scientific validity of any reaffirmation or revision of the National Ambient Air Quality Standards for Particulate Material.

The Clean Air Scientific Advisory Committee would appreciate being advised of the Agency's plans for addressing the issues we have raised.

Sincerely,

George T. Wolff, Ph.D.

EPA-SAB-CASAC-LTR-96-008

Honorable Carol M. Browner
Administrator
U.S. Environmental Protection Agency
401 M. Street SW
Washington, DC 20460

Subject: Closure by the Clean Air Scientific Advisory Committee (CASAC) on the
             Staff Paper for Particulate Matter

Dear Ms. Browner:

        The Clean Air Scientific Advisory Committee (CASAC) of EPA's Science
Advisory Board (SAB) has held a series of public meetings during its peer review of the
Agency's draft documents which will form part of the basis for your decision regarding
the National Ambient Air Quality Standards (NAAQS) for Particulate Matter (PM). The
Committee has held public meetings on December 12-13, 1994 (planning and
introductory issues); August 3-4, 1995 (review of the initial draft Criteria Document);
December 14-15, 1995 (review of the revised draft Criteria Document and the first draft
of the Staff Paper); February 29, 1996 (review of the revised draft Criteria Document -
specified chapters only, and the Office of Air Quality Planning and Standards (OAQPS)
Risk Assessment Plan); and May 16-17, 1996 (review of the revised draft Staff Paper).
The primary Agency draft documents that we have reviewed are the: a) *Air Quality
Criteria for Particulate Matter* (the "Criteria Document" prepared by the National Center
for Environmental Assessment - Research Triangle Park, NC - ORD), b) *Review of the
National Ambient Air Quality Standards for Particulate Matter: Policy Assessment of
Scientific and Technical Information* (the "Staff Paper" prepared by the Office of Air
Quality Planning and Standards - Research Triangle Park, NC - OAR), and c) *A
Particulate Matter Risk Analysis for Philadelphia and Los Angeles* (draft), 1996,
Prepared by Abt Associates for US EPA.

        As part of our review process, we have kept you informed of our findings through
three letter reports: a) *Clean Air Scientific Advisory Committee (CASAC) Comments on
the April 1995 draft Air Quality Criteria for Particulate Matter* (EPA-SAB-CASAC-LTR-
95-005; August 30, 1995); b) *Clean Air Scientific Advisory Committee (CASAC)
Comments on the November, 1995 Drafts of the Air Quality Criteria for Particulate*

Matter and the Review of the National Ambient Air Quality Standards for Particulate Matter: Policy Assessment of Scientific and Technical Information (OAQPS Staff Paper), (EPA-SAB-CASAC-LTR-96-003, January 5, 1996), and c) *Closure by the Clean Air Scientific Advisory Committee (CASAC) on the draft Air Quality Criteria for Particulate Matter* (EPA-SAB-CASAC-LTR-96-005, March 15, 1996).

The Clean Air Scientific Advisory Committee, supplemented by a number of expert Consultants (hereinafter referred to as the "Panel"), reviewed a first draft of the Staff Paper for Particulate Matter at the December 14 and 15, 1995 meeting in Chapel Hill, NC. At that meeting and in subsequent written comments by individual members which were provided to EPA Staff, the Panel made numerous recommendations for improving the draft document. The Panel met again on May 16, 1996 in Chapel Hill, NC and on May 17, 1996 in Research Triangle Park, NC to review a revised draft of the Staff Paper and the recommendations contained within the Staff Paper for the level and form of the proposed PM NAAQS. This letter is a summary of our findings and conclusions from that meeting.

It was the consensus of the Panel that although our understanding of the health effects of PM is far from complete, the Staff Paper, when revised, will provide an adequate summary of our present understanding of the scientific basis for making regulatory decisions concerning PM standards. Seventeen of the twenty-one Panel members voted for closure. There were two no votes, one abstention, and one absence. However, most of the members who voted for closure did so under the assumption that the Agency would make significant changes to the next version of the Staff Paper which is due by July 15, 1996 (a court ordered mandate). The desired changes have been articulated to your staff at the meeting and subsequently in writing.

The Panel endorses the EPA Staff's recommendation not to establish a separate secondary PM NAAQS for regulating regional haze and agrees that there is an inadequate basis for establishing a secondary NAAQS to reduce soiling and material damage effects.

The attached table (Table I) summarizes the Panel members' recommendations concerning the form and levels of the primary standards. Although some Panel members prefer to have a direct measurement of coarse mode PM ($PM_{10-2.5}$) rather than using PM_{10} as a surrogate for it, there is a consensus that retaining an annual PM_{10} NAAQS at the current level is reasonable at this time. A majority of the members recommend keeping the present 24-hour PM_{10} NAAQS, at least as an option for the Administrator to consider, although those commenting on the form of the standard strongly recommended that the form be changed to one that is more robust than the current standard. There was also a consensus that a new $PM_{2.5}$ NAAQS be established, with nineteen Panel members endorsing the concept of a 24-hour and/or an annual $PM_{2.5}$ NAAQS. The remaining two Panel members did not think any $PM_{2.5}$

NAAQS was justified. However, as indicated in Table I, there was no consensus on the level, averaging time, or form of a $PM_{2.5}$ NAAQS. At first examination of Table I, the diversity of opinion is obvious and appears to defy further characterization. However, the opinions expressed by those endorsing new $PM_{2.5}$ NAAQS can be classified into three broad categories. Four Panel members supported specific ranges or levels within or toward the lower end of the staff's recommended ranges. Seven Panel members supported specific ranges or levels near, at, or above the upper end of staff's recommended ranges. Eight other Panel members declined to select a specific range or level, but most had comments which appear as footnotes in Table I.

A number of Panel members based their support for a $PM_{2.5}$ NAAQS on the following reasoning: there is strong consistency and coherence of information indicating that high concentrations of urban air pollution adversely affect human health, there are already NAAQS that deal with all the major components of that pollution except $PM_{2.5}$, and there are strong reasons to believe that $PM_{2.5}$ is at least as important as $PM_{10-2.5}$ in producing adverse health effects.

Part of this diversity of opinion can be attributed to the accelerated review schedule. While your staff is to be highly commended for producing such quality documents in such a short period of time, the deadlines did not allow adequate time to analyze, integrate, interpret, and debate the available data on this very complex issue. Nor does a court-ordered schedule recognize that achieving the goal of a scientifically defensible NAAQS for PM may require iterative steps to be taken in which new data are acquired to fill obvious and critical voids in our knowledge. The previous PM NAAQS review took eight years to complete.

The diversity of opinion also reflects the many unanswered questions and uncertainties associated with establishing causality of the association between $PM_{2.5}$ and mortality. The Panel members who recommended the most stringent $PM_{2.5}$ NAAQS, similar to the lower part of the ranges recommended by the Staff, did so because they concluded that the consistency and coherence of the epidemiology studies made a compelling case for causality of this association. However, the remaining Panel members were influenced, to varying degrees by the many unanswered questions and uncertainties regarding the issue of causality. The concerns include: exposure misclassification, measurement error, the influence of confounders, the shape of the dose-response function, the use of a national $PM_{2.5}/PM_{10}$ ratio to estimate local $PM_{2.5}$ concentrations, the fraction of the daily mortality that is advanced by a few days because of pollution, the lack of an understanding of toxicological mechanisms, and the existence of possible alternative explanations.

In recommending that the staff carry out a risk assessment, it was the expectation of CASAC that the risk assessments would narrow the diversity of opinion by evaluating how all of the uncertainties propagate throughout the entire model.
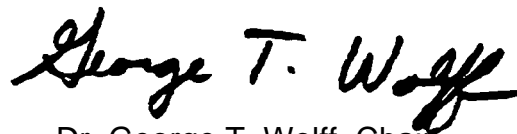

However, not all of the uncertainties could be included and the combined effect of all of them could not be examined. The Panel recommended that additional analyses be conducted to present combined uncertainties. However, currently the risk assessments are of limited value in narrowing the diversity of opinion within the Panel.

The Panel is unanimous, however, in its desire to avoid being in a similar situation when the next PM NAAQS review cycle is under way by a future CASAC Panel. The Agency must immediately implement a targeted research program to address these unanswered questions and uncertainties. It is also essential that we obtain long-term $PM_{2.5}$ measurements. CASAC is ready to assist the Agency in the development of a comprehensive research plan that will address the questions which need answers before the next PM review cycle is completed. We understand that your staff is preparing a PM research plan for our review later this summer. We look forward to providing our comments on this important matter.

CASAC recognizes that your statutory responsibility to set standards requires public health policy judgments in addition to determinations of a strictly scientific nature. While the Panel is willing to advise you further on the PM standard, we see no need, in view of the already extensive comments provided, to review any proposed PM standards prior to their publication in the Federal Register. In this instance, the public comment period will provide sufficient opportunity for the Panel to provide any additional comment or review that may be necessary.

Thank you for the opportunity to present the Panel's views on this important public health issue. We look forward to your response to the advice contained in this letter.

Sincerely,

Dr. George T. Wolff, Chair
Clean Air Scientific Advisory Committee

TABLE I
Summary of CASAC Panel Members Recommendations
(all units μg/m^3)

		$PM_{2.5}$ 24-hr	$PM_{2.5}$ Annual	PM_{10} 24-hr	PM_{10} Annual
Current NAAQS		N/A	N/A	150	50
EPA Staff Recommendation		18 - 65	12.5 - 20	150[13]	40 - 50
Name	**Discipline**				
Ayres	M.D.	yes[2]	yes[2]	150	50
Hopke	Atmos. Sci.	20 - 50[3]	20 - 30	no	40 -50[4]
Jacobson	Plant Biologist	yes[2]	yes[2]	150	50
Koutrakis	Atmos. Sci.	yes[2,5,6]	yes[2,5,6]	no	yes[4]
Larntz	Statistician	no	25-30[7]	no	yes[2]

Wolff	Atmos. Sci.	$\geq$75[3,7]	no	150[3]	50

[1] not present at meeting; recommendations based on written comments
[2] declined to select a value or range
[3] recommends a more robust 24-hr. form
[4] perfers a $PM_{10-2.5}$ standard rather than a PM_{10} standard
[5] concerned upper range is too low based on national $PM_{2.5}/PM_{10}$ ratio
[6] leans towards high end of Staff recommended range

[7] desires equivalent stringency as present PM_{10} standards

[8] if EPA decides a $PM_{2.5}$ NAAQS is required, the 24-hr. and annual standards should be 75 and 25 $\mu g/m^3$, respectively with a robust form

[9] yes, but decision not based on epidemiological studies

[10] low end of EPA's proposed range is inappropriate; desires levels selected to include areas for which there is broad public and technical agreement that they have $PM_{2.5}$ pollution problems

[11] only if EPA has confidence that reducing $PM_{2.5}$ will indeed reduce the components of particles responsible for their adverse effects

[12] concerned lower end of range is oo close to background

[13] the annual standard may be sufficient; 24-hr level recommended if 24-hour standard retained

Our Nation's Air

## Air Quality Improves as America Grows

https://gispub.epa.gov/air/trendsreport/2019

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

Economic Growth with Cleaner Air

Between 1970 and 2018, the combined emissions of the six common pollutants ($PM_{2.5}$ and PM_{10}, SO_2, NO_X, VOCs, CO and Pb) dropped by 74 percent. This progress occurred while the U.S. economy continued to grow, Americans drove more miles and population and energy use increased.

Comparison of Growth Areas and Declining Emissions 1970-2018

- +275% Gross Domestic Product
- Vehicles Miles Traveled
- Population
- Energy Consumption
- CO_2 Emissions
- -74% Aggregate Emissions (Six Common Pollutants)

(Percent Change axis: 300%, 200%, 100%, 0%, -100%; Years: 1970, 2000, 2010, 2018)
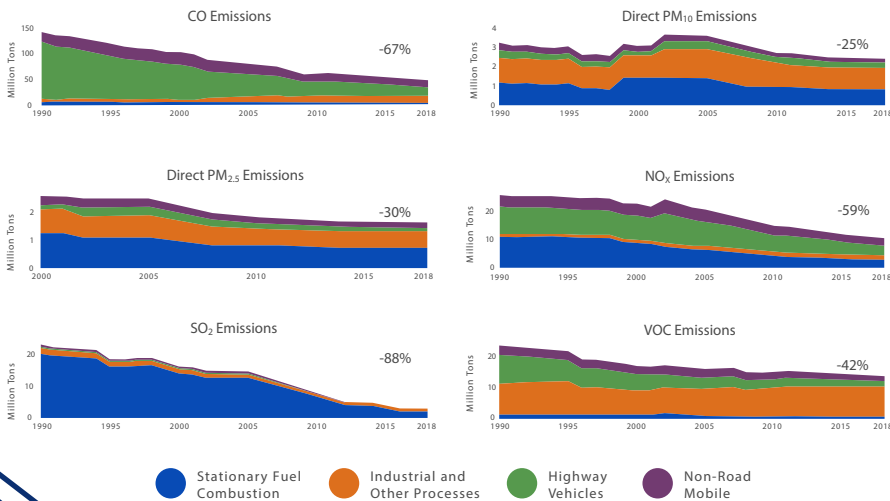

Air Quality Trends Show Clean Air Progress

While some pollutants continue to pose serious air quality problems in areas of the U.S., nationally, criteria air pollutant concentrations have dropped significantly since 1990 improving quality of life for many Americans. Air quality improves as America grows.

Declining National Air Pollutant Concentration Averages

- CO -74%
- Pb (from 2010) -82%
- NO_2 annual -57%
- NO_2 1-hour -50%
- O_3 -21%
- PM_{10} -26%
- $PM_{2.5}$ annual (from 2000) -39%
- $PM_{2.5}$ 24-hour (from 2000) -34%
- SO_2 -89%

Most Recent National Standard

(Percent Above or Below NAAQS (%) axis: 100%, 50%, 0%, -50%, -100%; Years: 1990, 1992, 1994, 1996, 1998, 2000, 2002, 2004, 2006, 2008, 2010, 2012, 2014, 2016, 2018)

Legend: Pb (3-month), CO (8-hour), NO_2 (annual), NO_2 (1-hour), O_3 (8-hour), $PM_{2.5}$ (annual), $PM_{2.5}$ (24-hour), PM_{10} (24-hour), SO_2 (1-hour)
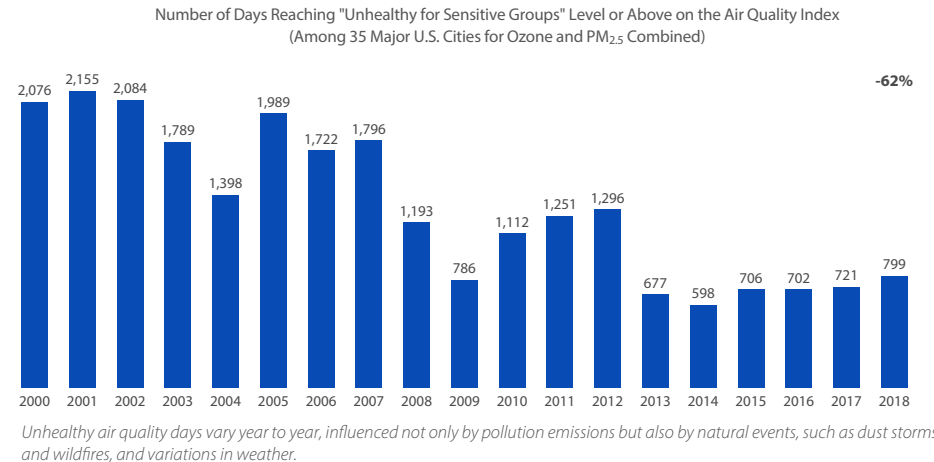

Air Pollutant Emissions Decreasing

Emissions of key air pollutants continue to decline from 1990 levels. These reductions are driven by federal and state implementation of stationary and mobile source regulations.

- CO Emissions -67%
- Direct PM_{10} Emissions -25%
- Direct $PM_{2.5}$ Emissions -30%
- NO_X Emissions -59%
- SO_2 Emissions -88%
- VOC Emissions -42%

Legend: Stationary Fuel Combustion | Industrial and Other Processes | Highway Vehicles | Non-Road Mobile

Unhealthy Air Days Show Long-Term Improvement

The Air Quality Index (AQI) is a color-coded index EPA uses to communicate daily air pollution for ozone, particle pollution, NO_2, CO, and SO_2. A value in the unhealthy range, above national air quality standard for any pollutant, is of concern first for sensitive groups, then for everyone as the AQI value increases. Fewer unhealthy air quality days means better health, longevity, and quality of life for all of us.

Number of Days Reaching "Unhealthy for Sensitive Groups" Level or Above on the Air Quality Index (Among 35 Major U.S. Cities for Ozone and $PM_{2.5}$ Combined)

-62%

Year	Days
2000	2,076
2001	2,155
2002	2,084
2003	1,789
2004	1,398
2005	1,989
2006	1,722
2007	1,796
2008	1,193
2009	786
2010	1,112
2011	1,251
2012	1,296
2013	677
2014	598
2015	706
2016	702
2017	721
2018	799

Unhealthy air quality days vary year to year, influenced not only by pollution emissions but also by natural events, such as dust storms and wildfires, and variations in weather.

Status and Trends Through 2018

4. The fourth justification for retaining the current PM NAAQS is contained in Our Nation's Air Summary Chart of "Air Quality Improves as America Grows" shown above and in the points below

a. Recent trends in air quality, including innovation-driven progress across emissions, concentrations, and U.S. competitiveness, demonstrate that a more stringent particulate matter NAAQS is not necessary.

b. In the entire U.S., only 9 full counties and 7 partial counties (out of more than 3,000) fail to meet the most recent national standards for fine particulate matter, which were set by the Obama Administration at a level designed to protect public health with an adequate margin of safety for susceptible populations. 14 of these counties are located in California:

c. In recent years, the U.S. has had far lower fine particulate matter levels than nearly any country on earth. At present, U.S. concentrations are less than one-sixth the global average, seven times below China, and roughly half of particulate matter levels in continental Europe.

d. EPA's June 2020 Our Nation's Air report demonstrates dramatic recent progress for particulate matter. Across the U.S., fine particulate matter concentrations have dropped by roughly 43 percent between 2000 and 2019. Over that same period, direct emissions of fine particulate matter also fell by 43 percent, and anthropogenic emissions of pollutants that can be a precursor to PM2.5 followed a similar trend, including sulfur dioxide (down 88 percent), oxides of nitrogen (down 61 percent), and volatile organic compounds (down 28 percent).

e. Between 1970 and 2019, the combined emissions of the six common pollutants (PM2.5 and PM10, SO2, NOx, VOCs, CO and Pb) dropped by 77 percent. This progress occurred while the U.S. economy continued to grow, Americans drove more miles, and population and energy use increased.
