Subject: Request re 2011 Congress of Epidemiology Symposium

February 23, 2011

Michael L. Jerrett, Ph.D.
Associate Professor
Environmental Health Sciences
University of California, Berkeley
jerrett@berkeley.edu

Dear Dr. Jerrett:

Because of your expertise in fine particulate air pollution (PM2.5) epidemiology, particularly your authorship of the Health Effects Institute (HEI) Research Report 140 and your participation in the February 26, 2010 CARB PM2.5 Symposium, I request your participation in my Symposium, "Ethical Aspects of Small Epidemiologic Risks," at the Third North American Congress of Epidemiology (CoE) in Montreal, Canada during June 21-24, 2011 (<http://www.epicongress2011.org/>). The preliminary abstract for this Symposium is shown below and is posted on the CoE website (<http://www.epiresearch.org/congress/sympdesc.php?i=0120>). As explained in the abstract, this Symposium will address ethical issues in epidemiology, with particular focus on one specific risk: the relationship between PM2.5 and total mortality. I will present the case that the NAAQS for PM2.5 should not be lowered, primarily because of serious ethical issues surrounding the existing PM2.5 epidemiologic evidence. Given your qualifications and the prominent use by US EPA of results from HEI Research Report 140, you are an ideal epidemiologist to present the case for US EPA's proposed lowering of the NAAQS for PM2.5 and its use of HEI Research Report 140. The Symposium will be moderated by a neutral third person, still to be selected, who has expertise in epidemiologic ethics but no involvement with PM2.5 epidemiology. The total time for the Symposium is 90 minutes and I estimate that the two major presentations will be about 30 minutes each, with the remaining 30

minutes for the moderator to make comments and lead discussion with the presenters and the audience. The exact details of the Symposium, including selection of all participants, will be worked out during the next two months.

Please let me know as soon as possible if you are willing to participate in this Symposium.

Thank you very much for your consideration.

Sincerely yours,

James E. Enstrom, Ph.D., M.P.H.

Ethical Aspects of Small Epidemiologic Risks

Chair: James E. Enstrom

Description: Relative risks on the order of 1.2 have been used to establish “causal” relationships and to implement regulations designed to reduce the environmental exposures involved in these relationships. However, there is substantial controversy regarding the scientific validity of these relationships and the use of them for regulatory purposes. The above concerns will be applied to the relationship between fine particulate air pollution (PM_{2.5}) and total mortality, which the US Environmental Protection Agency estimates is responsible for up to about 100,000 premature US deaths per year. This relationship has been used by the California Air Resources Board to justify expensive diesel vehicle regulations designed to reduce PM_{2.5} levels in California. US EPA is currently proposing a lower National Ambient Air Quality Standard for PM_{2.5} based on this relationship. However, there is clear geographic variation in PM_{2.5} mortality risk, with no significant risk in California. Thus, a single national standard seems inappropriate and the CARB diesel regulations appear unjustified. Important ethical issues, such as, misrepresentation of scientific evidence and lack of independent reanalysis of underlying data, will be discussed by speakers with divergent opinions on this relationship in order to examine this important example of the interaction between epidemiology and public policy.

thank you very much for thinking of me but I am under a very heavy travel restriction currently at Health Canada and have not been approved to attend this conference!!

also, due to my job at Health Canada I would not be allowed to comment on whether regulations in another country (or even Canada) should or should not be changed

thus I must respectfully decline your kind offer
